Since it had to use Mozilla Firefox, it still can't resolve character encoding even if it's set to an UTF-8. I have tried setting Character Encoding in web browser to UTF-8 or UTF-16 with no success. I have searched in google and stackoverflow, but haven't found any solution to this issue. Is there any possible way to resolve this issue? Note: The issue doesn't occur if it is set to UTF-8 in settings. A: Set Character encoding to: UTF-8, Windows-1251. Date: August 25, 2016 Many seniors report that they feel guilty if they want to stay at home instead of going to the hospital or a care facility, or if they decline an invitation to participate in a program offered by a hospital. But that's a misconception that can put patients at risk. "Many seniors are great at resisting invasive medical tests and treatments that they think could hurt them or are not necessary," said Dr. Kimberly S. Strawn, chair of the American Geriatrics Society's geriatric medicine subcommittee. "But they are confused about their rights and the code of medical ethics. Many end up in the emergency department for tests and treatments that could have been avoided." Here are some tips for older patients who want to stay home and avoid care in the hospital: Tell the doctor you want to avoid being admitted to a hospital, and tell the nurse you want to avoid the hospital at the first sign of a problem. Ask your doctor if you really need a test. Ask why you are being asked to undergo a test, and ask if you can have the test first, before you consent to it. If you refuse medical treatment, say so in writing, and tell the doctor why. Make sure the next visit will be with the same doctor, so you won't be forced to change doctors when your care is transferred to a different hospital or a different doctor. When you refuse medical treatment, it is better to refuse care from your primary care physician as well, and to seek care at a primary care clinic than it is to refuse care at a hospital or a specialty clinic. Don't be afraid to ask a doctor questions. Ask if the questions you ask are important to the care and treatment you are getting. Ask, for example, if a treatment is necessary to prevent a disease f678ea9f9e
